The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polyurethane Vulcanizing Agent MOCA competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Polyurethane rubber curing agent MOCA is an aromatic diamine compound commonly used as a curing agent and chain extender for cast polyurethane elastomers. It features moderate reactivity and the ability to fully crosslink with isocyanate groups, imparting excellent mechanical strength, wear resistance, tear resistance, oil resistance, and fatigue resistance to finished products. Global production in 2024 was estimated to be approximately 39,000 tons, with an average selling price of US\$2,750 per ton. Polyurethane rubber vulcanizing agent MOCA, chemically known as 3,3'-dichloro-4,4'-diaminodiphenylmethane, is derived from o-chloroaniline and formaldehyde, which form the molecular backbone of MOCA through a condensation reaction. The synthesis process also requires auxiliary materials such as catalysts and organic solvents to promote the reaction and ensure product purity. MOCA is primarily used for the vulcanization of cast polyurethane elastomers. Its products, due to their excellent wear and oil resistance, high strength, and impact resistance, are used in the automotive industry (oil seals, sealing rings, and shock absorbers), aerospace (seals and cable sheathing), industrial rubber products, and sports equipment.

The global Polyurethane Vulcanizing Agent MOCA market size was estimated at USD 105.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
