Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Poly(vinyl alcohol-co-ethylene) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Poly(vinyl alcohol-co-ethylene), commonly known as EVOH, is a random copolymer composed of vinyl alcohol and ethylene units, produced by hydrolyzing ethylene-vinyl acetate copolymers. This material combines the excellent oxygen barrier properties of polyvinyl alcohol with the moisture resistance and flexibility imparted by ethylene. Its high transparency, chemical resistance, and ability to be co-extruded with other polymers make it ideal for multilayer packaging films, particularly in the food, pharmaceutical, and automotive industries where extended shelf life and vapor containment are critical. The barrier effectiveness of EVOH depends on its ethylene content—lower ethylene ratios enhance gas impermeability but reduce water resistance. The key market driver for Poly(vinyl alcohol-co-ethylene) (EVOH) is the growing demand for high-performance barrier materials in food and pharmaceutical packaging. As consumers and regulatory bodies increasingly prioritize extended shelf life, reduced food waste, and protection from oxygen and contaminants, EVOH's superior gas barrier properties make it an essential component in multilayer packaging films. Additionally, its use is expanding in automotive fuel systems to prevent hydrocarbon emissions and in cosmetic and medical packaging to ensure product stability. Rising environmental concerns are also promoting EVOH as a more sustainable alternative in packaging when combined with recyclable materials.

The global Poly(vinyl alcohol-co-ethylene) market size was estimated at USD 1274.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
