Abstracts

Polyvinyl chloride (PVC) decking is a synthetic building material used primarily for outdoor deck surfaces, composed of polyvinyl chloride resin combined with various additives such as stabilizers, lubricants, and pigments to enhance durability, weather resistance, and aesthetic appeal. It is engineered to mimic the appearance of natural wood while offering superior performance characteristics, including resistance to moisture, rot, insects, and UV degradation, making it a low-maintenance alternative to traditional wood decking. The product is available in various profiles, colors, and textures, often featuring capped composite designs where a protective polymer layer surrounds a core material to further improve scratch resistance and longevity. As part of the broader composite decking market, PVC decking is distinguished by its 100% plastic composition, which eliminates organic content and reduces susceptibility to staining, warping, and fading over time.

The global Polyvinyl Chloride Decking market size was estimated at USD 4520.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
