Abstracts

Porcelain glaze coating, sometimes referred to as ceramic coating or nano-ceramic coating in the automotive and industrial sectors, is a liquid polymer applied to surfaces?most commonly vehicle exteriors?to create a semi-permanent, protective layer that bonds chemically with the factory paint. This coating is composed primarily of silicon dioxide (SiO?) or other ceramic nanoparticles suspended in a resin carrier, which, upon curing, forms a hard, transparent, and hydrophobic shield that enhances gloss, resists UV degradation, prevents oxidation, and repels dirt, water, and minor scratches more effectively than traditional waxes or sealants. While initially popular in high-end automotive detailing, its applications have expanded to include marine, aerospace, architectural glass, and consumer electronics, driven by advancements in nanotechnology that improve durability, ease of application, and performance in harsh environmental conditions.

The global Porcelain Glaze Coating market size was estimated at USD 2450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
