Abstracts

A porcine pericardium resorbable membrane is a biologically derived medical material commonly used in dental and surgical procedures for guided tissue regeneration (GTR) and guided bone regeneration (GBR). It is made from the pericardial tissue of pigs, processed to retain its natural collagen structure while eliminating antigenicity to ensure biocompatibility. This membrane serves as a barrier to prevent soft tissue invasion into bone defects, promoting effective healing and regeneration of underlying bone and tissue. Over time, it resorbs naturally within the body, eliminating the need for a second surgical procedure for removal. Widely used in periodontal treatments, implantology, and maxillofacial surgeries, porcine pericardium resorbable membranes offer excellent handling properties, strength, and predictable resorption rates, making them a trusted choice for clinicians.

The global Porcine Pericardium Resorbable Membrane market size was estimated at USD 155.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.10% during the forecast period.
