Abstracts

Porous carbon nanofibers are a type of nanostructured carbon material composed of hollow, cylindrical fibers with a high surface area and a porous structure. These fibers are typically synthesized using processes like electrospinning or chemical vapor deposition and are characterized by their high mechanical strength, electrical conductivity, and large surface area, which make them ideal for various applications. The porous nature of these nanofibers enhances their capacity for adsorbing gases, ions, or molecules, making them valuable in energy storage devices such as supercapacitors and batteries, as well as in filtration, sensors, and catalytic processes. Their unique properties allow for high performance in environments requiring efficient transport of charge or molecules.

The global Porous Carbon Nanofibers market size was estimated at USD 649.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
