Abstracts

Porous ceramic vacuum chucks are specialized fixtures used primarily in semiconductor manufacturing, electronics assembly, and precision machining to securely hold thin, flat, or fragile workpieces during processing. These components function by utilizing a network of interconnected microscopic pores within the ceramic material, which, when connected to a vacuum source, generate a uniform holding force across the surface, enabling non-marking, contamination-free, and highly stable clamping of substrates such as silicon wafers, glass panels, or delicate composite materials without mechanical contact. The porous structure allows for efficient air evacuation while maintaining structural integrity under thermal and mechanical stress, making them ideal for applications requiring high flatness, thermal resistance, and minimal particle generation in cleanroom environments.

The global Porous Ceramic Vacuum Chuck market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
