Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Porous Polyethylene Implants competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Porous polyethylene implants are a type of biomedical material based on high-density polyethylene (HDPE) and formed through a special process. Their core feature lies in their three-dimensional porous structure (porosity of approximately 50%, pore size of 100 to 400 microns), which can promote the in-growth of host tissues (such as fibrovascular and bone tissue), thereby enhancing the stability and biointegration of the implant. At the same time, the material is non-toxic, non-immunogenic, and biocompatible with no rejection or inflammatory response after long-term implantation, as well as good strength and toughness. It can be shaped by heating to suit different anatomical needs and is widely used in cranio-maxillofacial surgery (such as facial bone reconstruction, orbital repair), rhinoplasty (such as nasal dorsum filling), oral and maxillofacial surgery (such as maxillary reconstruction) and other fields, becoming a key implant material with both mechanical properties and biological activity.

The global Porous Polyethylene Implants market size was estimated at USD 154.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
