Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Porous Polymer Filter Membrane competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of porous polymer filtration membranes is 51.37 million square meters, with an average selling price of US\$35 per square meter. Porous polymer filter membranes are a type of filtration medium made from polymer materials and possessing micron- or nanometer-scale pore structures. They are widely used for separating and purifying particles, microorganisms, and molecular-level impurities in liquids or gases. Their core principle is to achieve selective permeation or retention of substances of varying particle sizes and molecular weights through the sieving effect of the membrane surface or internal pores. Common materials include polyvinylidene fluoride (PVDF), polyethersulfone (PES), polytetrafluoroethylene (PTFE), nylon, and polypropylene (PP). The membrane structure can be symmetrical or asymmetrical, with a uniform pore size distribution. They offer high flux, low adsorption, and strong chemical stability. These membranes are widely used in biopharmaceuticals, food and beverages, electronics and semiconductors, water treatment, and environmental monitoring, and are a core material in modern separation technologies.

The global Porous Polymer Filter Membrane market size was estimated at USD 1798.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
