Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Porous Tantalum Metal Rod competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Porous tantalum metal rod is a metal support similar to trabecular bone structure. It is made of porous tantalum metal and has special physical and biological properties. It plays an important role in orthopedic treatment, especially in the treatment of early femoral head necrosis. The porosity of porous tantalum metal rod is usually 75% - 80%, and the average pore size is about 430 μ m. This porous structure makes its elastic modulus close to that of human cancellous bone, which can effectively reduce the stress shielding effect. Its internal interconnected pore structure provides a three-dimensional space for bone tissue growth. Experiments show that soft tissue can grow 1cm in 4 weeks after implantation and 2.3cm in 16 weeks, while promoting the vascularization process. In orthopedic applications, the metal rod is implanted in the necrotic area of the femoral head through minimally invasive surgery, which can provide immediate mechanical support to prevent collapse and guide new bone formation through osteoconductivity. It has excellent biocompatibility, and osteoblasts can adhere, proliferate and differentiate to form trabecular bone structure. Clinical studies have shown that the Harris hip score increased by an average of 127.9% after surgery, significantly improving the functional status of patients. This implant achieves mechanical matching with bone tissue through a special manufacturing process, and its friction coefficient of 0.98 ensures long-term stability after implantation. Compared with traditional materials, porous tantalum metal rods have significant advantages in bioactivity, bone integration efficiency and mechanical properties, and have become an innovative solution for the treatment of early femoral head necrosis.

The global Porous Tantalum Metal Rod market size was estimated at USD 169.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
