## Abstracts

Port Decarbonisation refers to the use of a series of technical, management and policy measures to fundamentally reduce greenhouse gas emissions generated by port activities, and ultimately achieve the goal of net zero carbon emissions. Its core lies in promoting the transformation of energy structure, improving operational efficiency and achieving coordinated governance of the entire supply chain. Specific measures include: promoting the use of shore power instead of fuel power generation by ships at berth; promoting port operating equipment driven by new energy such as electric or hydrogen energy; optimizing port logistics management, reducing equipment idling and ship waiting time through digital scheduling; building renewable energy facilities (such as wind power and photovoltaics) to provide clean electricity for ports; and exploring the supply and refueling services of low-carbon fuels such as green methanol and ammonia. Port decarbonization is not only a key action to address climate change, but also a core strategy to reshape port competitiveness and integrate into the global green shipping network. It involves in-depth collaboration among port operators, shipping companies, logistics companies and government agencies.

The global Port Decarbonisation market size was estimated at USD 634.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
