## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Port Multiplier competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A port multiplexer is a hardware or software technology that allows a single port to support multiple devices or applications. As hardware, a SATA port multiplier connects multiple SATA drives through a single SATA host port. As software, port multiplexing technology allows multiple applications to bind to the same network port simultaneously, overcoming the traditional limitation that a port can only be bound to one application. In 2024, the global production of port multiplexers was 83 million units, with an average price of \$15 per unit. The upstream of the port multiplexer industry chain mainly consists of semiconductor chip manufacturers, signal switching chip suppliers, and PCB board and connector manufacturers. Representative companies include Texas Instruments, Analog Devices, NXP, ROHM, and Amphenol, which provide multiplexing control chips, switching circuits, and high-speed connection components. Downstream customers are primarily laptop, server, industrial automation equipment, communication switch, and automotive electronics manufacturers, with representative clients including Dell, Cisco, Siemens, Huawei, and Toyota. Downstream demand focuses on data interface integration, signal path optimization, and system space saving, especially in multi-interface systems such as USB4, HDMI, Ethernet, and CAN bus, where port multiplexers can significantly reduce hardware complexity and cost. Industry development trends show a trend towards high-speed signal integration, miniaturization, and multi-protocol compatibility. With the trend towards thinner and lighter laptops and the increase in the number of ports on servers and edge computing devices, multiplexers are evolving from single-channel to multi-protocol multiplexing, supporting dynamic switching between multiple standards such as Thunderbolt, USB, and DP.

Driving factors include increased data transmission rates, diversification of device interface standards, centralization of automated device interfaces, and the evolution of new energy vehicle electronic architecture from distributed to centralized systems. Obstacles mainly include the difficulty of controlling high-speed signal attenuation, stringent EMI shielding requirements, increased costs of protocol compatibility verification, and increased design complexity due to multi-channel multiplexing. Furthermore, reliance on imported high-end chips also constrains the domestic production of low-cost multiplexers. Currently, the industry's single-line annual production capacity is approximately 0.5 to 0.8 million multiplexed chips or modules, with an overall industry gross margin between 25% and 35%.

The global Port Multiplier market size was estimated at USD 1245.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
