### Report Overview

A glucose sensor is the part of a continuous glucose monitoring (CGM) system that is inserted under the skin and measures your glucose (sugar) levels. The sensor measures the level of glucose in the interstitial fluid (fluid surrounding the cell) every 10 seconds and changes it into an electrical signal. The signal represents the amount of sugar in the blood. A small transmitter attaches to the sensor.

The glucose monitoring devices market is a very profitable market with a tremendous development potential owing to continuous technological advancement in these devices, the rapid increase in aging population, the convenience of continuous sugar monitoring over conventional monitoring, increasing the number of diabetic patients and early detection of hypo and hyperglycemic diabetes. Growth in this segment is expected to owe to rising use such devices by healthcare professionals to monitor real-time blood sugar levels for better management of diabetes. Increased patient awareness and concern about the sugar level has increased the number of self-monitoring blood sugar users.
