Abstracts

A portable chlorine sensor is a device designed to detect and measure the concentration of chlorine in various environments in a convenient and mobile manner. It usually adopts electrochemical, optical or other sensing principles. Electrochemical portable chlorine sensors work by using the redox reaction of chlorine with specific electrodes to generate an electrical signal proportional to the chlorine concentration. Optical sensors, on the other hand, may detect chlorine based on the absorption or scattering of light by chlorine molecules. These sensors are equipped with a compact and lightweight design, making them easy to carry and operate in the field. They are widely used in applications such as water quality monitoring in swimming pools, water treatment plants, and industrial wastewater treatment, as well as in environmental monitoring and the food and beverage industry to ensure the safety and quality of products and processes related to chlorine content.

The global Portable Chlorine Sensor market size was estimated at USD 708.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
