Eddy-current testing (also commonly seen as eddy current testing and ECT) is one of many electromagnetic testing methods used in nondestructive testing (NDT) making use of electromagnetic induction to detect and characterize surface and sub-surface flaws in conductive materials. Portable Eddy Current NDT Equipment can be easily and quickly applied to current applications. The governments of many developed countries such as the United States, Canada, and Germany are committed to creating a safer working environment for workers. Based on this, governments of various countries are passing laws to protect the safe environment in the workplace, especially the safe environment involving the use of machines. For example, heavy machinery used in manufacturing, automotive, and other industrial fields has a lot of regulations in terms of implementing strict safety measures. Nowadays, the number of accidents that cause physical injuries to ground workers is increasing, and sometimes such accidents are fatal. Therefore, in order to ensure the safety of factories, governments around the world are enforcing laws to ensure the safety of people and processes in the workplace. Due to the above circumstances, in order to ensure a safe working environment, the demand for eddy current non-destructive testing equipment is also increasing.

The global Portable Eddy Current NDT Equipment market size was estimated at USD 163.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
