Abstracts

A Portable Immunofluorescence Analyzer is a device used to detect and measure the presence of specific proteins or pathogens in a sample using immunofluorescence technology. It can be used in a variety of settings such as clinical laboratories, hospitals, clinics, and even in remote areas where access to traditional lab facilities is limited. The Portable Immunofluorescence Analyzer typically includes a microscope, light source, and camera, along with necessary software and reagents for analyzing samples. The sample is treated with fluorescent antibodies that bind specifically to the target protein or pathogen. When exposed to light, the fluorescent-tagged antibodies emit a signal that is detected by the camera.
