A Portable Long-term EEG (Electroencephalogram) is a medical device used to record the electrical activity of the brain over an extended period while the patient is mobile or in their natural environment. Unlike traditional EEG, which is typically done in a clinical setting for short durations, a portable long-term EEG is designed for continuous monitoring, often lasting several days or even weeks. This allows healthcare providers to observe brain activity during normal daily activities, which can be essential for diagnosing conditions that are not easily detected in a short, controlled setting.

The global Portable Long-term EEG market size was estimated at USD 562.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
