Abstracts

A portable thermal fogging machine is a heat atomization device that is easy to carry and use on the move. It is mainly used to convert liquids into extremely fine foggy particles. It usually consists of a heating element, a liquid storage container, a spray nozzle, a control circuit, and a battery or power interface. During operation, the heating element heats the liquid in the liquid storage container to a certain temperature, causing the liquid to evaporate rapidly and form high-temperature steam. These steams are sprayed out through the spray nozzle and quickly cool and condense into tiny droplets in the air, thus producing an atomization effect. This device is commonly used in disinfection, pest control, humidification, and some scenarios that require local atomization treatment, such as homes, offices, small-scale farms, and cars. It is characterized by simple operation, high atomization efficiency, and easy portability, meeting users' atomization needs in different places.

The global Portable Thermal Fogging Machine market size was estimated at USD 2870.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
