Abstracts

Portable through wall radar refers to a specialized category of non-invasive detection devices that utilize radar technology?typically operating in the ultra-wideband (UWB) or microwave frequency range?to detect and track the presence, motion, and location of objects or individuals behind solid obstructions such as walls, doors, or debris. These systems function by transmitting low-power electromagnetic signals that penetrate non-metallic barriers; the signals reflect off objects and return to the device, where algorithms process the data to generate real-time information about movement, distance, and sometimes even vital signs like respiration. Designed for portability, these handheld or compact units are battery-operated and often feature intuitive interfaces, making them suitable for rapid deployment in dynamic scenarios. Applications span law enforcement, search and rescue operations, military reconnaissance, and building inspection, where situational awareness in obscured environments is critical.

The global Portable Through Wall Radar market size was estimated at USD 120.85 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
