Abstracts

A portable video laryngoscope is a handheld medical device used primarily for airway management and endotracheal intubation, combining traditional laryngoscope functionality with integrated video technology to provide real-time visualization of the vocal cords and glottis on a built-in or external display. This device typically features a high-resolution camera at the tip of a blade or stylet, often with anti-fogging and illumination capabilities, enabling clinicians to perform intubations with enhanced visibility, reduced cervical spine movement, and improved first-pass success rates, especially in difficult airway scenarios or pre-hospital settings. Its portability, often powered by rechargeable batteries and designed for durability and ease of disinfection, makes it suitable for use across diverse clinical environments, including emergency departments, operating rooms, ICUs, and field medicine, thereby addressing limitations of conventional direct laryngoscopy by offering a more ergonomic, teachable, and efficient tool for securing patient airways.

The global Portable Video Laryngoscope market size was estimated at USD 452.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
