Abstracts

Ports Electrification refers to the integrated application of electric drive technologies (such as shore power systems, electric loading and unloading equipment, and hydrogen fuel cells) and renewable energy (photovoltaic and wind power) to comprehensively replace the fuel power of ship auxiliary engines, loading and unloading machinery, and transport vehicles in port operations. This will achieve clean energy supply and zero or low-emission equipment operation, and rely on intelligent energy management and Internet of Things technologies to improve operational efficiency. Ultimately, the goal is to build a green and low-carbon port energy ecosystem covering the entire chain of ship berthing, cargo loading and unloading, and horizontal transportation.

The global Ports Electrification market size was estimated at USD 1270.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
