Abstracts

The positioning engine server is a core service platform based on location data processing and algorithm calculation. It receives positioning signals from terminal devices (such as mobile phones, wearable devices, vehicles, and IoT sensors). Combining multiple sources of information, including satellite navigation (GPS/Beidou), cellular networks, Wi-Fi, Bluetooth, or UWB, the server outputs high-precision position results through data fusion, filtering, and real-time calculation. It then provides location services to upper-layer applications through standard interfaces. It is widely used in scenarios such as intelligent transportation, logistics tracking, emergency rescue, security monitoring, smart cities, and the Industrial Internet of Things, and is key infrastructure for implementing large-scale location services and location intelligence.

The global Positioning Engine Server market size was estimated at USD 2031.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.10% during the forecast period.
