Report Overview

Positive Photoresist Stripper is a chemical compound specifically designed for the removal of photoresist materials from semiconductor wafers or printed circuit boards during the manufacturing process. This product is formulated to selectively dissolve the exposed, cross-linked areas of positive-tone photoresist, which hardens upon exposure to light, while leaving the unexposed, soluble areas intact. The stripper works by breaking down the chemical bonds within the photoresist, allowing for easy removal without damaging the underlying substrate. It is crucial for maintaining the integrity of the device and ensuring the accuracy of the pattern transfer process. The effectiveness of a positive photoresist stripper is often measured by its ability to remove resist quickly and completely, without leaving residues, and its compatibility with various substrate materials and subsequent processing steps.
