## Abstracts

A positive pressure isolator is a specialized containment system designed to maintain a higher internal pressure relative to the surrounding environment, ensuring that the enclosed workspace remains uncontaminated by external airborne particles or microorganisms. These devices are widely utilized in pharmaceutical manufacturing, biotechnology, microbiology, and sterile compounding, where maintaining product integrity and operator safety is critical. Constructed with rigid walls, HEPA or ULPA filtration systems, and integrated glove ports for manipulation, positive pressure isolators safeguard sensitive processes such as aseptic filling, cell culture handling, and the production of sterile drugs or medical devices. By creating a controlled, particle-free environment, they prevent ingress of contaminants while allowing safe handling of non-hazardous materials that require protection from the external atmosphere.

The global Positive Pressure Isolator market size was estimated at USD 225.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
