## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Positive Voltage Regulator IC competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A positive voltage regulator IC is an integrated circuit used to stably convert an input voltage into a fixed positive voltage output. It typically uses a linear or low-dropout (LDO) architecture to provide a stable power supply to analog circuits, microcontrollers, and other sensitive devices. It is widely used in consumer electronics, industrial control, communications equipment, automotive electronics, and other fields. In 2024, global sales of positive voltage regulator ICs were expected to be approximately 18.5 billion units, with an average unit price of approximately US\$0.14, and a typical single-line annual production capacity of approximately 400 million units. Its upstream suppliers mainly include suppliers of silicon wafers, doping gases, metal interconnect materials, packaging substrates, lead frames, and packaging and testing materials, belonging to the semiconductor manufacturing and packaging and testing industry; its downstream suppliers are manufacturers of power management modules, motherboards, motor control, battery management, and automotive electronic systems. The gross profit margin is generally between 22% and 28%. The production of one voltage regulator IC consumes approximately 0.0004 8-inch silicon wafers, 0.002 grams of packaging metal material, and 0.001 grams of epoxy molding compound. Downstream manufacturers typically consume an average of 2-4 ICs per smartphone, 10-15 per industrial control board, and 30-50 per electric vehicle control system. Within the product cost structure, wafer manufacturing and testing account for approximately 50%, packaging and testing for approximately 25%, R&D and equipment depreciation for approximately 10%, raw materials and logistics for approximately 10%, and administrative and sales expenses for approximately 5%. Product parameter

classifications include 1.8V, 3.3V, 5V, and adjustable voltage regulators by output voltage, standard linear and low-dropout (LDO) types by dropout voltage performance, SOT, TO, DFN, and WLCSP packaging types, and consumer, industrial, and automotive grades by application.

The global Positive Voltage Regulator IC market size was estimated at USD 2590.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
