## Abstracts

Post Cmp Residue Removal refers to the specialized cleaning processes and solutions employed in semiconductor manufacturing to eliminate chemical-mechanical planarization (CMP) residues?such as slurry particles, organic contaminants, and byproducts?from wafer surfaces after polishing. This step is critical for maintaining device performance and yield, as residual materials can cause defects, electrical failures, or reliability issues in advanced semiconductor nodes. The process typically involves wet cleaning techniques using customized chemistries, including acidic or alkaline formulations, along with mechanical aids like megasonic energy, to ensure thorough removal without damaging delicate structures or materials on the wafer. As semiconductor geometries continue to shrink, the precision and efficiency of Post Cmp Residue Removal have become increasingly vital to enabling higher integration densities and meeting stringent quality standards in chip production.

The global Post Cmp Residue Removal market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
