Abstracts

A post column flow splitter is a chromatographic accessory designed to divide the effluent stream from a liquid chromatography column into two or more separate pathways, enabling simultaneous detection or collection through multiple analytical instruments or fraction collectors. This device is critical in applications requiring parallel analysis, such as when coupling liquid chromatography with mass spectrometry and another detector (e.g., UV or fluorescence), or when preparative-scale separations need directed fractionation. By maintaining consistent flow rates and minimizing dead volume, post column flow splitters enhance analytical flexibility, improve throughput, and support method development without compromising chromatographic resolution or detector performance.

The global Post Column Flow Splitters market size was estimated at USD 18.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
