Abstracts

Post combustion carbon capture refers to the process of separating and collecting carbon dioxide from the exhaust gas generated after the combustion of fossil fuels by using liquid solvents and heating. This technology is usually applied to traditional facilities such as coal-fired power plants and steel mills. By adding a capture device at the end of the exhaust flue, carbon dioxide can be effectively captured without large-scale adjustments to the combustion process itself.

The global Post Combustion Carbon Capture market size was estimated at USD 954.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.30% during the forecast period.
