Abstracts

Post Etch Residue Remover (PERR) refers to specialized chemical formulations used in semiconductor manufacturing to clean residual contaminants such as polymers, metal halides, and sidewall passivation layers left on silicon wafers after plasma etching processes, ensuring surface purity, preventing device defects, and maintaining electrical performance in integrated circuits. The global market is primarily driven by the expanding semiconductor industry, technological advancements in node sizes (e.g., sub-7nm processes), and increasing demand for high-performance electronic devices, with key regions including Asia-Pacific (notably Taiwan, South Korea, and China due to strong foundry presence), North America, and Europe. Major players such as Entegris, DuPont, BASF, and Fujifilm dominate the competitive landscape, focusing on developing low-chemical-footprint, selective, and environmentally sustainable formulations to meet stringent industry standards. Challenges include high R&D costs, regulatory pressures concerning chemical waste, and cyclical demand tied to semiconductor capital expenditure; however, growth opportunities persist with the rise of IoT, AI chips, and advanced packaging technologies requiring finer and more complex etching processes.

The global Post Etch Residue Remover market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
