## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Potassium Type Silica Sol competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Potassium type silica sol is a colloidal solution containing potassium ions, which is made of a mixture of silicate colloids and potassium compounds (such as potassium hydroxide). The main characteristics of potassium silica sol are that it has high ion exchange capacity and surfactivity, and has excellent selective adsorption, catalytic and ion exchange properties. Potassium silicon sol is often used in the fields of water treatment ring repair, separation and purification, and catalysis. In water treatment, potassium silicon sol can remove heavy gold heavy ions, organic pollutants and microorganisms in water; in environmental restoration, it can adsorb harmful substances concentrated in soil, such as heavy metal ions and organic matter; in separation and purification process, potassium silicon sol can be used to separate and enrich target substances; in catalytic reaction, it can serve as a catalyst support to improve the catalytic efficiency of the catalyst. In addition, potassium-type silica sol also has high stability and reusability, and can be used multiple times without affecting its performance. However, the preparation process of potassium-type silica sol is relatively complicated, and factors such as the pH value, temperature and mixing ratio of the solution need to be controlled to obtain the required performance and structure.

The global Potassium Type Silica Sol market size was estimated at USD 183.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
