Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Potassium Water Glass competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Potassium water glass, also known as industrial potassium silicate, is a colorless or slightly colored transparent viscous liquid or glassy body. It can be widely used in anti-corrosion, casting, oil fields, drilling, or high-end coatings. In anti-corrosion applications, it is mainly used as an adhesive for various anti-corrosion industries such as acid resistance, heat resistance, and wear resistance. It is formulated into acid resistant and heat-resistant materials and made into potassium water glass cement, potassium water glass mortar, and potassium water glass concrete according to different purposes. It has the advantages of high adhesion, good acid resistance, and heat resistance. As a high-temperature and heat-resistant shock resistant coating application. Potassium silicate is pollution-free, has high hardness, excellent weather resistance and high temperature resistance. By modifying it to improve its water resistance, it becomes a good high-temperature and heat-resistant adhesive. It can be used for improving acidic soil by spraying potassium silicate aqueous solution, which can significantly inhibit the absorption of heavy metals and toxic elements such as Cr and Cd. The production of potassium silicate drilling fluid is a good inhibitor with excellent anti collapse performance. Used as an adhesive in advanced welding and in glass manufacturing, it has better transparency and weather resistance. In 2024, global Potassium Water Glass production reached approximately 612 K MT, with an average global market price of around US\$ 847 per MT. The dry process (calcination method) production line is the most mainstream, technologically mature, and capable method for producing all modular products. The product quality is high, but the energy consumption is also high. The annual production capacity of a single production line is usually

between 10000 MT and MT tons (referring to finished potassium silicate solution, with a concentration usually around 40%). The wet process (atmospheric dissolution method) production line has a relatively simple process, low investment, and low energy consumption, but is mainly suitable for producing low modulus (usually modulus
