Abstracts

Poultry feed anticoccidials are specialized feed additives designed to prevent and control coccidiosis, a parasitic disease caused by protozoa of the *Eimeria* genus, which affects the intestinal tracts of poultry such as chickens, turkeys, and ducks. These anticoccidial agents work by disrupting the life cycle of the parasites, either by inhibiting their development or by killing them at various stages, thereby reducing morbidity, mortality, and production losses in commercial poultry operations. They are commonly administered through medicated feed at controlled dosages to ensure efficacy while minimizing the risk of drug resistance or residues in meat and eggs, and they are broadly categorized into chemical anticoccidials (synthetic compounds) and ionophores (fermentation-derived antibiotics), with some products also incorporating natural alternatives like phytogenics or vaccines as part of integrated coccidiosis management strategies.

The global Poultry Feed Anticoccidials market size was estimated at USD 1850.67 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.15% during the forecast period.
