Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Powder for Inhalation competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.Powder for inhalation (used in dry powder inhalers, DPIs) delivers active pharmaceutical ingredients as respirable powders driven by patient inhalation and is widely used for local treatment of respiratory diseases (asthma, COPD) and selected systemic applications (e.g., inhaled insulin). Key technical challenges are particle-size distribution, powder flow/dispersibility, physical stability and device–formulation compatibility (capsule-based, blister, or multi-dose devices); common manufacturing technologies include spray-drying, spray-freeze-drying and particle-engineering approaches to achieve the required aerosol performance. Upstream inputs include inhalation-grade APIs (with tight impurity/residual-solvent specs) and lung-safe excipients — lactose remains the predominant carrier in many commercial formulations — and many projects outsource formulation development and scale-up to specialized CDMOs.In 2024, the global market average price for Powder for Inhalation was USD 26.7 per unit, with a total sales volume of 512 million units.

The global Powder for Inhalation market size was estimated at USD 13670.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
