Abstracts

A powder anti - mold agent is a type of substance in powder form that is designed to prevent or inhibit the growth of mold. Its primary function is to prevent the growth of mold. Mold is a type of fungus that can thrive in various environments, especially in areas with high humidity, poor ventilation, or on certain organic materials. The powder anti - mold agent works by creating an environment that is unfavorable for mold spores to germinate and grow. It may do this by altering the pH level, reducing moisture availability, or releasing substances that are toxic to mold at low concentrations. In cases where mold has already started to grow, the anti - mold agent can slow down or stop its further development. It can disrupt the metabolic processes of the mold, preventing it from spreading and causing more damage to the surface or material it has colonized.

The global Powder Anti-mold Agent market size was estimated at USD 157.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
