Abstracts

Powder Compression Molding (PCM) services utilize mechanical pressure to compact metal or non-metal powders in a mold into a green body with a specific shape and density. This process, a core element of powder metallurgy, is typically performed at room temperature or under heated conditions. Uniaxial or multiaxial pressing densifies the powder particles, forming parts with initial strength. Subsequent processes such as sintering, heat treatment, and machining can be performed to achieve final performance. PCM services encompass not only the operation of the pressing equipment but also mold design, parameter optimization, automated control, quality inspection, and batch production management. They are widely used in the manufacture of high-precision, high-strength, and complex small parts, and are particularly well-suited for the industrial molding of materials such as cemented carbide, magnetic materials, ceramics, and iron-based alloys. The powder compression molding (PCM) service market is at a critical stage of technological upgrading and industrial restructuring. Upstream processes are trending toward high-purity, spherical powders and high-precision mold manufacturing, with automated control systems becoming standard. Downstream, demand for lightweighting vehicles, miniaturized consumer electronics, and new medical technologies is driving growth in high-precision pressing services. Future development will focus on multi-material composite pressing, green manufacturing standards, AI-assisted parameter optimization, and the deployment of regional service centers to build a smarter and more sustainable global PCM industry chain.

The global Powder Compression Molding (PCM) Services market size was estimated at USD 1314.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
