Abstracts

Powder-free intraoral scanners are advanced dental devices used to capture detailed digital impressions of a patient's oral cavity without the need for a contrast agent, such as titanium dioxide powder. Traditional intraoral scanners often required a fine layer of powder to be applied to the teeth and soft tissues to reduce glare and improve accuracy. However, modern powder-free scanners use sophisticated optical technology, such as structured light or laser, to generate precise 3D images directly, enhancing patient comfort, reducing mess, and streamlining the dental workflow.

The global Powder-free Intraoral Scanners market size was estimated at USD 372.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
