Abstracts

Powder sintered porous titanium plate is a porous material with a rigid structure made of titanium or titanium alloy powder raw materials through shaping and high-temperature sintering. This material contains a large number of interconnected pores. The size, distribution and porosity of the pores depend on the powder particle size composition and preparation process. It usually has a volume porosity of 15% to 60% and a pore diameter between 1 and 100 microns. Powder sintered porous titanium plates are widely used in the manufacturing of filters, porous electrodes, fire extinguishing devices, antifreeze devices and other fields due to their good permeability, thermal and electrical conductivity, high and low temperature resistance, thermal shock resistance and media corrosion resistance.
