Abstracts

The powder tablet press die is a key component used to hold and shape powder materials and apply pressure to prepare products. The powder tablet press die usually consists of two parts, the upper die and the lower die. The upper die is generally fixed on the machine tool, while the lower die can move up and down. The space between the upper and lower dies is used to place the powder material, and pressure is applied in this space to form the desired product shape. In the working process of the powder tablet press, the die plays a vital role. First, the powder material is evenly placed in the die sleeve, and then the pressure head is installed and the position of each component is correct. Next, the machine tool applies appropriate pressure to squeeze the powder material in the die and gradually shape it. Finally, the molded product is removed from the die using the film removal sleeve to ensure that the product is intact.

The global Powder Tablet Press Mold market size was estimated at USD 263.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.00% during the forecast period.
