Report Overview

The powder tanker is composed of a chassis and a special device for bulk transportation of powder particles. The bodywork mainly includes additional transmission system (the additional transmission system mainly includes power take-off, additional transmission shaft, air compressor, etc.), tank assembly, pipeline system, and auxiliary devices. According to the number of cabins, the tank can be divided into single cabin, double cabin and three cabins; according to the length, it can be divided into 10 feet, 20 feet, 30 feet, 40 feet, 45 feet, etc.; according to the material, it can be divided into aluminum alloy and carbon steel. The shape of the tank is round, oval and square. The tank body is mainly composed of a head, a cylinder, a manhole cover and a fluidization device. The working principle of the powder tanker is that the power of the automobile engine is transmitted to the air compressor through the additional transmission device composed of the gearbox power take-off and the additional drive shaft, and the compressed air (or external compressed air) generated by the air compressor enters the tank. The powder material is fluidized by the fluidization device, and with the help of the pressure difference inside and outside the tank, the powder material is transported to the designated position outside the tank along the discharge pipeline along with the air. The powder tanker truck is suitable for bulk transportation of powder dry materials such as fly ash, cement, lime powder, ore powder, expansion agent, granular alkali, etc. whose particle diameter is not greater than 0.1mm.
