Report Overview:

Power-factor correction increases the power factor of a load, improving efficiency for the distribution system to which it is attached. Linear loads with low power factor (such as induction motors) can be corrected with a passive network of capacitors or inductors. Non-linear loads, such as rectifiers, distort the current drawn from the system. In such cases, active or passive power factor correction may be used to counteract the distortion and raise the power factor. The devices for correction of the power factor may be at a central substation, spread out over a distribution system, or built into power-consuming equipment.

The Global Power Factor Correction (PFC) Controller Market Size was estimated at USD 6981.45 million in 2023 and is projected to reach USD 8287.77 million by 2029, exhibiting a CAGR of 2.90% during the forecast period.
