The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Power Generation Casting competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Power Generation Castings are large and medium-sized metal cast components used in power generation equipment, including steam turbines, gas turbines, hydro turbines, wind turbine housings, generator frames, bearing housings, pump bodies, valve castings, and structural components. Materials typically include ductile iron, carbon steel, stainless steel, alloy steel, and high-temperature superalloys. Used in thermal power plants, nuclear power plants, hydro power, wind power, and distributed energy systems. Global average casting price (all mixed): US\$3,800 per ton. Global production: 620,000 tons of castings. Roughly 450,000 casting units (converted by category average). Average margin: 21%. Upstream: steel & iron scrap, alloy materials (Ni, Cr, Mo), casting sand, resin, molds, machining tools. Midstream: large foundries ? melting, molding, pouring, heat treatment, rough machining. Downstream: turbine OEMs, generator manufacturers, wind turbine manufacturers, EPC companies, utilities. Strong demand from wind power and gas turbine upgrades. Replacement of old thermal power plant components increases aftermarket castings. Lightweight, high-strength alloys and large integrated castings trending. China and India dominate growth in wind and hydro castings. Nuclear and hydropower require long-term, high-quality castings with strict standards.

The global Power Generation Casting market size was estimated at USD 2366.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
