Abstracts

Power inductors for 5G are specialized passive electronic components designed to filter, store, and manage energy in high-frequency circuits, particularly those operating within 5G infrastructure and devices; these inductors must exhibit low direct current resistance (DCR), high saturation current tolerance, minimal core losses, and stable performance across a broad frequency range (extending into millimeter-wave bands) to support the increased data rates, reduced latency, and enhanced power efficiency demanded by 5G applications such as base stations, small cells, massive MIMO systems, and RF power amplifiers. The market for these components is driven by the global rollout of 5G networks, advancements in telecommunications infrastructure, the proliferation of IoT and smart devices, and the need for miniaturization and improved thermal management in electronic designs, while facing challenges related to material costs, supply chain constraints, and the technical complexity of maintaining performance at higher frequencies and power densities. Key players include TDK Corporation, Murata Manufacturing, Vishay Intertechnology, Taiyo Yuden, and Coilcraft, with innovation focusing on advanced core materials (such as low-loss ferrites and metal composites), automated manufacturing techniques, and custom solutions tailored to specific 5G operational requirements.

The global Power Inductors For 5G market size was estimated at USD 1976.48 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
