Report Overview

An inductor, also called a coil/choke/ reactor, is a passive two-terminal electrical component that stores energy in a magnetic field when electric current flows through it. Inductor can be subdivided into radio frequency inductors and power inductors. RF Inductors is the inductors for high-frequency circuits are used in the high-frequency band from 10 MHz to several GHz. As these products require a high Q (Quality factor) value, most have a non-magnetic core structure, and they are mainly used in the high-frequency circuits of mobile communications equipment, such as mobile phones, wireless LAN, and others. Power inductors are solid state electronic component that receives and stores electrical energy utilizing a magnetic field. This field is typically created with tightly coiled conductive wire such as copper. Power inductors can be subdivided into integrated power inductors and non-integrated power inductors. At present, non-integrated power inductors occupy the main market share, but the share of integrated power inductors is gradually increasing.
