## Abstracts

Power line carrier system is a communication technology that uses existing power lines as information transmission media to realize the transmission of data, voice or control signals by superimposing high-frequency carrier signals on power lines. Its core feature is Without laying additional dedicated communication lines, communication networks can be built only by relying on power networks, with both "wired stability" and "wireless convenience".Market Concentration and Key Players:Internationally, the market concentration of power carrier system is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, Siemens, Hitachi Energy and ZIV and other large manufacturers; from the domestic point of view, power carrier systems still have a lot of room for development.Manufacturing Processes and Market Trends:The core of the power line carrier system manufacturing process lies in the integration of coupling devices and digital modulation technology: the communication signal is injected into the power line through coupling capacitors and high-frequency wave traps, and the power frequency interference is isolated; the modulation link adopts orthogonal frequency division multiplexing technology to disperse the signal in the 3-500kHz frequency band to resist the power grid noise, and combines adaptive equalization and LDPC coding to improve the transmission stability. The all-digital chip design supports the efficient demodulation and real-time processing of the system.In terms of market trends, China PLC industry is driven by smart grid and "double-carbon" policy, and is expected to reach 100 billion levels by 2030, with an average annual growth rate of more than 10%. Technology convergence becomes key: 5G networks provide high-bandwidth support for remote grid control, AI algorithms enable predictive maintenance, and application scenarios extend from distribution automation to smart home interconnection and industrial microgrid management. However, challenges still exist, such as cross-transformer signal attenuation needs special isolator compensation, domestic enterprises dominate the mid-and low-end

market in the chip field, but high-end chip technology still lags behind international giants and needs to accelerate breakthrough.

The global Power Line Carrier System market size was estimated at USD 615.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.70% during the forecast period.
