Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Power-to-X (P2X) Systems competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Power-to-X (P2X) systems refer to a suite of technologies that convert surplus electrical energy—primarily from renewable sources like wind or solar—into other forms of energy or materials for storage, transport, or further use. The "X" in Power-to-X can represent various energy carriers or chemical products, including hydrogen (Power-to-Hydrogen), methane (Power-to-Methane), synthetic fuels (Power-to-Fuels), chemicals (Power-to-Chemicals), and heat (Power-to-Heat). P2X systems typically involve key steps such as electrolysis (to split water into hydrogen and oxygen), followed by subsequent conversion processes like methanation, Fischer-Tropsch synthesis, or ammonia synthesis. These technologies are essential for sector coupling, enabling decarbonization across industries such as transportation, heating, and chemical manufacturing. Power-to-X (P2X) systems exhibit diverse technical parameters depending on the conversion pathway. Electrolyzers (PEM, alkaline, or solid oxide) typically operate at 60–85°C, consume 48–60 kWh/kg H₂, and produce hydrogen at 10–70 bar with output rates from 0.5 to over 1,000 Nm³/h. Methanation units, using catalytic or biological processes, operate at 250–350°C and 1–10 bar to produce >95% pure CH₄, yielding approximately 0.36 Nm³/kWh. Fischer-Tropsch synthesis for Power-to-Liquids converts hydrogen and captured CO₂ into synthetic fuels at 200–350°C and 10–40 bar, with hydrocarbon selectivity favoring C_{2–5} yields above 60%. Power-to-Ammonia systems use green hydrogen in Haber-Bosch processes at 400–500°C and 150–300 bar to generate >99.5% pure ammonia with system efficiencies around 60%. Power-to-Heat technologies, employing resistive heating or heat pumps, convert electricity into thermal energy at up to 99% efficiency for integration with water, molten

salt, or PCM-based thermal storage systems.

The global Power-to-X (P2X) Systems market size was estimated at USD 6283.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.20% during the forecast period.
