Abstracts

A powered hang glider harness is a specialized piece of equipment designed to securely connect the pilot to the hang glider while integrating the motor unit, typically mounted on the pilot's back, and providing necessary support, comfort, and functionality during flight. It typically includes a sturdy yet adjustable seat or cocoon-like structure, shoulder and leg straps, attachment points for the motor and propeller assembly, storage for fuel or batteries, and often features padding, ventilation, and quick-release mechanisms for safety. The harness must distribute the weight of the motor and pilot evenly, allow freedom of movement for control inputs, and protect the pilot in the event of a rough landing or emergency, making it a critical component that blends ergonomics, safety engineering, and aeronautical design.
