Report Overview

Pre-coating lubricants are substances that are applied to a surface before a forming or shaping process to reduce friction and wear between the surface and the tool or die. These lubricants can be in the form of oils, greases, or dry films, and they are designed to protect the surface from damage and improve the quality of the finished product.

In metal forming processes, pre-coating lubricants are used to prevent the metal from sticking to the tool or die, which can cause defects such as scratches, scoring, and galling. They also help to reduce the amount of force required to form the metal, which can improve production efficiency and reduce tool wear.

In addition to metal forming, pre-coating lubricants are also used in other industrial processes such as stamping, forging, and extrusion. They can be applied by spraying, brushing, or dipping, and they are typically formulated to be compatible with the specific materials and processes involved.
