Abstracts

Pre-eclampsia is a serious pregnancy complication characterized by high blood pressure and signs of damage to organ systems, most often the liver and kidneys, typically occurring after 20 weeks of gestation in women whose blood pressure had been normal; it is a leading cause of maternal and fetal morbidity and mortality worldwide, and its treatment focuses on managing symptoms and preventing progression to life-threatening conditions such as eclampsia (seizures) or HELLP syndrome (hemolysis, elevated liver enzymes, low platelet count), with current standard care involving antihypertensive medications to control blood pressure, magnesium sulfate to prevent seizures, corticosteroids to aid fetal lung maturation if preterm delivery is necessary, and ultimately delivery of the baby and placenta as the only definitive cure. The market for pre-eclampsia treatment encompasses a range of pharmaceutical products, monitoring devices, and healthcare services aimed at early detection, management of maternal health, and improvement of neonatal outcomes, driven by increasing global incidence rates linked to factors such as advanced maternal age, obesity, and assisted reproductive technologies, alongside growing awareness and improved diagnostic capabilities; however, the lack of disease-modifying therapies beyond delivery represents a significant unmet medical need, spurring ongoing research into novel biomarkers, predictive algorithms, and therapeutic agents targeting underlying pathophysiological mechanisms like placental dysfunction and angiogenic imbalance.

The global Pre Eclampsia Treatment market size was estimated at USD 1189.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
