Abstracts

Pre-magnesiumized silicon-oxygen negative electrode materials belong to silicon oxide (SiO_x, x>1) matrix negative electrodes. By reacting with solid-phase reducing agents such as magnesium powder, SiO₂ is partially reduced to Si and a magnesium silicate phase is generated, which is evenly distributed on the surface and inside of the particles. These magnesium compounds can reduce the formation of irreversible lithium-silicon compounds in the first cycle, thereby significantly improving the initial coulombic efficiency (ICE) and improving the cycle life.

The global Pre-Magnesiated SiOx Anode Material market size was estimated at USD 130.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
