Abstracts

A pre-pressurized buffer tank is a specialized component within closed-loop hydronic heating and cooling systems, designed to absorb thermal expansion and maintain consistent system pressure by utilizing a pre-charged air cushion separated from the system fluid by a flexible diaphragm or bladder. These tanks prevent pressure fluctuations, reduce pump cycling, protect equipment from stress, and enhance overall system efficiency by accommodating changes in water volume due to temperature variations. Commonly constructed from steel or stainless steel with an internal butyl or EPDM membrane, they are essential in applications such as residential and commercial boilers, solar thermal systems, chilled water circuits, and industrial process heating, where stable hydraulic conditions are critical for performance and longevity.

The global Pre Pressurized Buffer Tank market size was estimated at USD 352.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
